Complications after Implantation / Replacement / Upgrade or lead revision (transvenous Systems) at 6 months

modified from Kirkfeldt et al, Eur Heart J. 2014

Subcutaneous System Heart / Vasculature untouched

Therapies:

- Biphasic shock, 80 J
- Postshock pacing only
- Charge time < 10 s

• Volume: 59.5 cc 130 grams

12.7 mm

- Weight:
- Thickness:
- Battery Longevity: 7.3 y

Commercially distributed in some European countries since 2009

FDA approval 2012

Indications:

Same as ICD

- no symptomatic bradycardia
- no frequent VTs that can be terminated with ATP

Contraindications

- Unipolar pacemaker

3-5% of patients not elegible (T-wave oversensing)

Effortless Registry: Major Complications requiring Intervention

modified from Lambiase et al, EHJ 2014

SICD Effortless Registry

456 Patients, 317 Episodes in 85 Patients

Conversion Efficacy in Testing 99.7 % Overall shock conversion rate 96 %

Appropriate Therapies7.2 % (Patients)Inappropriate Therapies7.0 % (Patients)

Effortless Registry: Appropriate and Inappropriate Shocks

- Does what it is supposed to do
- Moderate Complication rate (beginning of learning curve ?)
- no Rx
- Shock Box

Leadless Pacemaker

J. ELECTROCARDIOLOGY, 3 (3-4) 325-331, 1970

Special Article

Totally Self-Contained Intracardiac Pacemaker*

J. WILLIAM SPICKLER, PH.D., NED S. RASOR, PH.D.+, PAUL KEZDI, M.D. S. N. MISRA, M.D., K. E. ROBINS, P.E., AND CHARLES LeBOEUF, P.E.

SUMMARY

Recent developments in miniature long-life power sources and electronics, such as nuclear batteries and integrated circuits make feasible a new generation of pacemakers, the intracardiac pacemaker (IC), i.e., a completely self-contained pacemaker implanted inside the right ventricle by transvenous insertion. Since the IC pacemaker eliminates all leads, problems associated with the leads such

circuits have been improved substantia addition, the development of the endor catheter electrode has broadened the of operative procedures to include a portion of the patient population. Two problems that still exist with conver pacemakers are perforation or dislocat the transvenous electrode and the short the batteries that are presently used. Ir tion, there is a certain physical and p logical discomfort involved with Fig. 2. Some early unsatisfactory dummy capsules

Fig. 8. Nuclear-powered intracardiac pacemaker.

Leadless Pacemaker System proposed by Spickler in 1970

Leadless Pacemaker

5-7 mm diameter, 26 - 35 mm length

Bipolar Sensing

Battery 6.5 – 12 years

"retrievable"

VVIR

Leadless Pacemaker

Leadless Pacemaker Developments, Questions

Mechanical issues, perforations

stiff device

Leadless Pacemaker Developments, Questions

- Mechanical issues, perforations, embolization (Nanostim > Micra ?)
- Only VVIR -> combine multiple communicating devices into a multi site pacing system ?
- Retrievability: might be different after a few months compared to elective battery replacement
- R-function (heat driven in Nanostim model) ?

- well established since > 3 decades in high risk patients
- secondary prophylaxis
- primary prophylaxis

but

- -> patients with reversible causes for arrhythmias ?
- -> patients awaiting ICD Implantation
- -> patients after MI
 - Dinamit, Hohnloser et al, NEJM 2004
 - Valiant, Solomon et al, NEJM, 2005
- -> patients with system infection

Wearable Cardiac Defibrillator

Life Vest

Wearable Cardiac Defibrillator

- Elastic belt and shoulder strap
 - 4 dry sensing electrodes
 - 3 defibrillation electrodes
- battery (24 h use, 2 h charge)
- 600 g
- loop recorder, no pacing
- vibration signal, 2 sound alarms
- button to withhold the shock

-Monophasic shock (230 J), biphasic shock (150 J)

Wearable Cardiac Defibrillator

WEARIT/BIROAD: 289 Patienten, 8 events in 6 patients, 901 pts months Feldmann, Klein et al. Pacing Clin Electrophysiology, 2004

FDA approved 2002

Does what it is supposed to do, low shock incidence Chung et al, JACC 2010 WEARIT-II, ESC 2014

No proarrhythmia published so far

No randomized study

VEST registry: ongoing, Life Vest randomized vs. standard care after MI Primary Endpoint: sudden death 3 months after MI

Wearable Cardiac Defibrillator Limitations and Gaps of Knowledge

 post MI patients did receive appropriate shocks for VT/VF in DINAMIT, which did not result in improved survival
similar results in IRIS (Steinbeck et al, NEJM 2009)

 do appropriate therapies in this period translate into improved survival ?

• same outcomes with shocks from transvenous lead vs. subcutaneous vs. skin leads ?

• Patient selection: Small subgroup of post MI patients at risk

 ICDs prescribed by arrhythmia specialists, wearable defibrillators by physicians less experienced in the management of arrhythmias
-> more complications (programming, inappropriate shocks) ?

Sympathetic Nerve Activity and Survival In Heart Failure

Muscle Sympathetic Nerve Activity

Plasma Norepinephrine

Cohn et al, NEJM, 1984

Vagus Stimulation in Heart Failure

Zannad et al, Eur Heart J, 2014

Vagus Stimulation in Heart Failure

ANTHEM – HF: randomized left vs right Vagal Nerve Stimulation Pemchand et al, J Card Fail, 2014

- 60 patients
- significant improvement in LVEF
- no control group

NECTAR – HF: first sham controlled trial Zannad et al, Eur Heart J, 2014

- 96 patients, 63 treated
- study negative

INNOVATE – HF: ongoing trial

- different device with additional sensor in the right ventricle
- first results expected in 2016
