- Clear and up-dated definition of advanced heart failure
- In depth description of therapeutic options
- ≠ Guidelines
  - No classes of recommendation
  - Level of evidence not provided

# Definition of advanced heart failure

# Definition of advanced heart failure

## 4 CRITERIA + 1 CONDITION

### 1. Severe and persistent symptoms (dyspnea, fatigue, congestion)

- NYHA III advanced (minimal exercise) or NYHA IV (rest)

### 2. Severe heart dysfunction

- LVEF < 30%
- Severe diastolic dysfunction or high BNP NTproBNP levels (less clear)
- Severe isolated RV failure (ARVC)
- Severe non operable valve disease

### 3. Pulmonary or systemic congestion OR low cardiac output OR malignant arrhythmia

- High dose IV diuretics or inotropes
- > 1 episode in last 12 months

### 4. Severe impairment of functional capacity

- 6MWD < 300 m
- pVO<sub>2</sub> 12-14 ml/kg/min

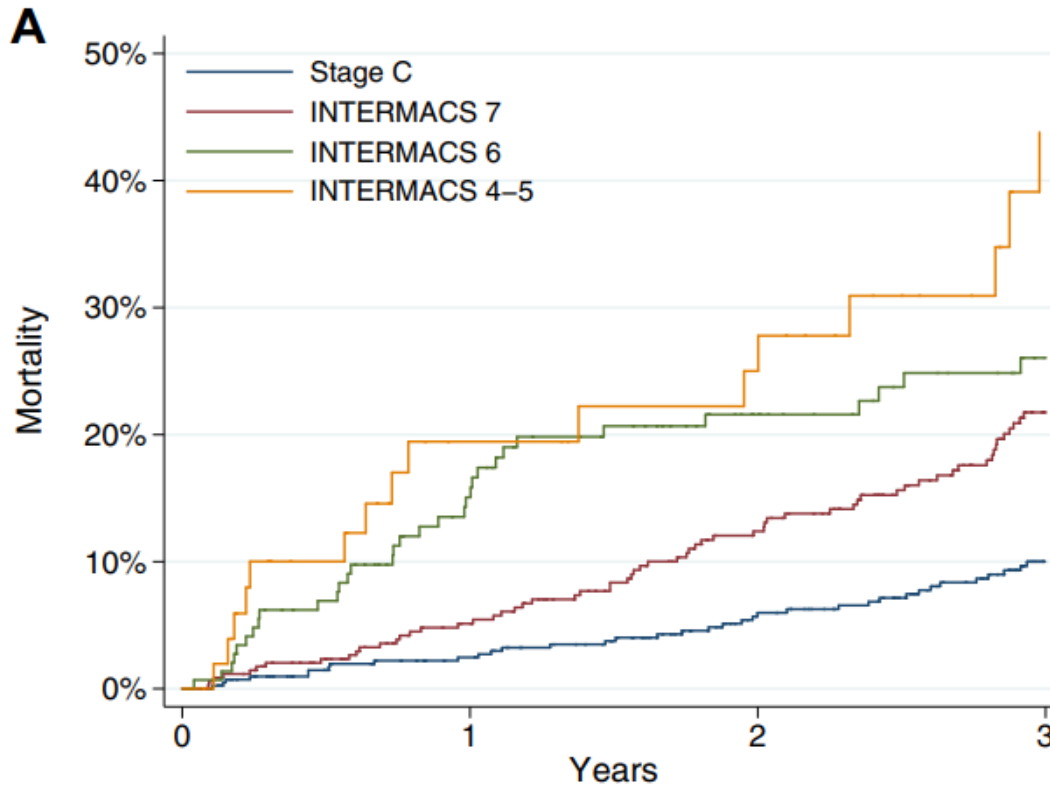

**Despite optimal guideline-directed therapy !**

# Very poor outcome of AdHF

423 patients stage C (systolic dysfunction + symptoms)

546 patients with advanced HF, categorized according to INTERMACS classification

Censoring at time of transplantation or LVAD implantation

IM 7 = stage 3 (No meaningful exercise possible)

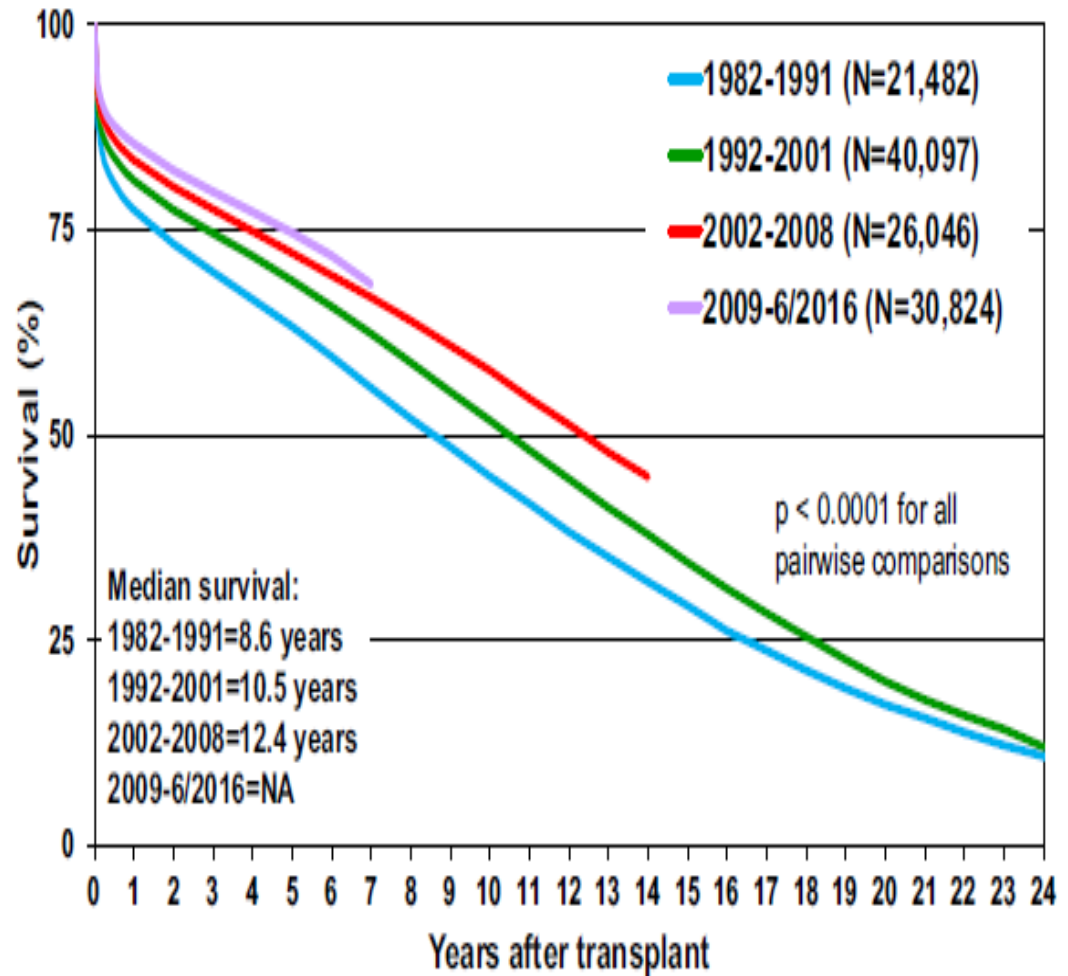

IM 6 = limited to mild exertion

IM 5 = limited to light exercise

IM 4 = uncomfortable at rest

Despite guideline directed therapy !

# Therapeutic options N°1: heart transplantation

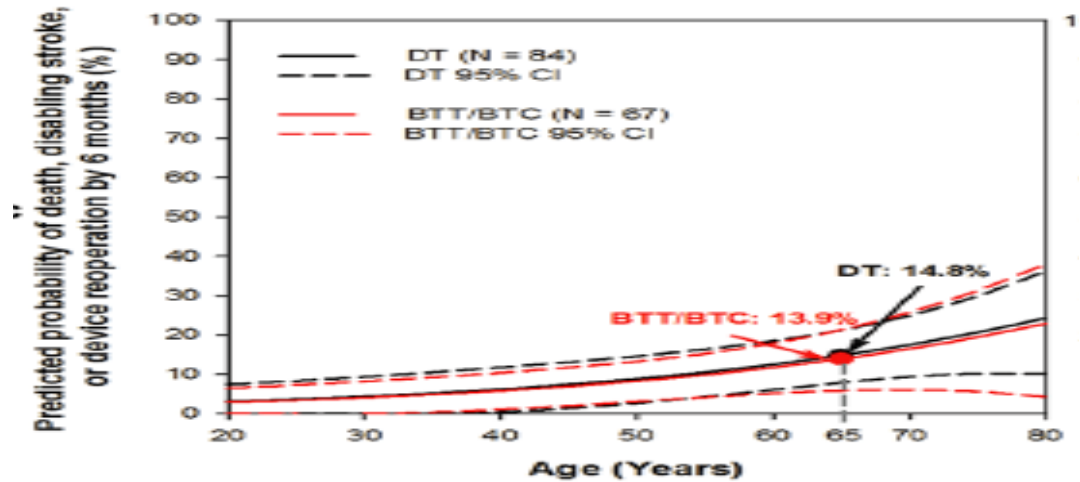

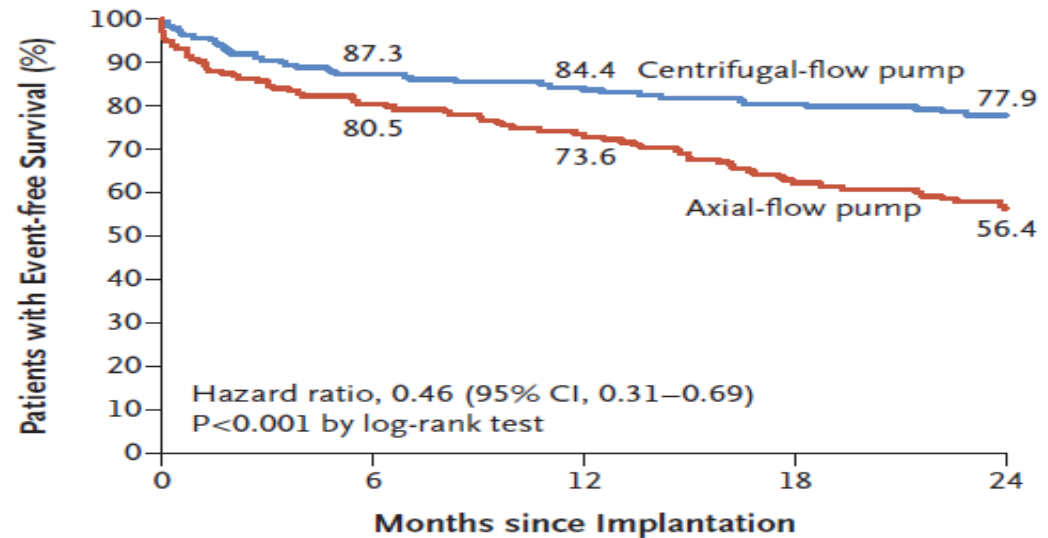

Since 03.12.1967

10 years survival > 65%

# Rx N°2 : Destination therapy with LVAD

2y survival without disabling stroke / device malfunction

# New inotropes for non HTx – non MCS candidates ?

## Levosimendan

- Myofilament Calcium sensitizer
- Repeated infusions in AdHF

# Treatment optimisation....

## An example

# Mrs I. M; 57 years old in 2016

## History :

- Sent from another canton after 2 episodes of acute heart failure with the question of heart transplantation
- Acute myeloid leukemia, 15 years ago, treated with anthacyclins (among other therapies). In remission after medulla transplantation
- Progressive decrease of LVEF already 10 years ago
- Stage NYHA 3 (1 climb of stairs)

## Clinical Assessment

- No congestion, IVC 17 mm, inspiratory collapse 40%
- BP : 99 /64 mmhg
- Sinus rythm 72 bpm, narrow QRS (90 ms)

## Investigations

- LVEF 29%, no significant MR, no RV dysfunction
- Peak VO<sub>2</sub> : 13.9 ml/kg /min, VE/VCO<sub>2</sub> slope 36

## Mrs I. M; 57 years old in 2016

### Labo :

- NTproBNP 2100
- Creatinine 161  $\mu\text{mol/l}$
- K<sup>+</sup> 4.9 mmol /L

### Treatment

- Candesartan 4 mg x 2
- Carvedilol 6.25 x 2
- Spironolactone 12.5 mg
- Torasemide 20 mg

ICD in primary prevention, no sustained VT

# Does this lady have advanced HF ?

## 4 CRITERIA + 1 CONDITION

### 1. Severe and persistent symptoms (dyspnea, fatigue, congestion)

- NYHA III advanced (minimal exercise) or NYHA IV (rest)

### 2. Severe heart dysfunction

- LVEF < 30%
- Severe diastolic dysfunction or high BNP NTproBNP levels (less clear)
- Severe isolated RV failure (ARVC)
- Severe non operable valve disease

### 3. Pulmonary or systemic congestion OR low cardiac output OR malignant arrhythmia

- High dose IV diuretics or inotropes
- > 1 episode in last 12 months

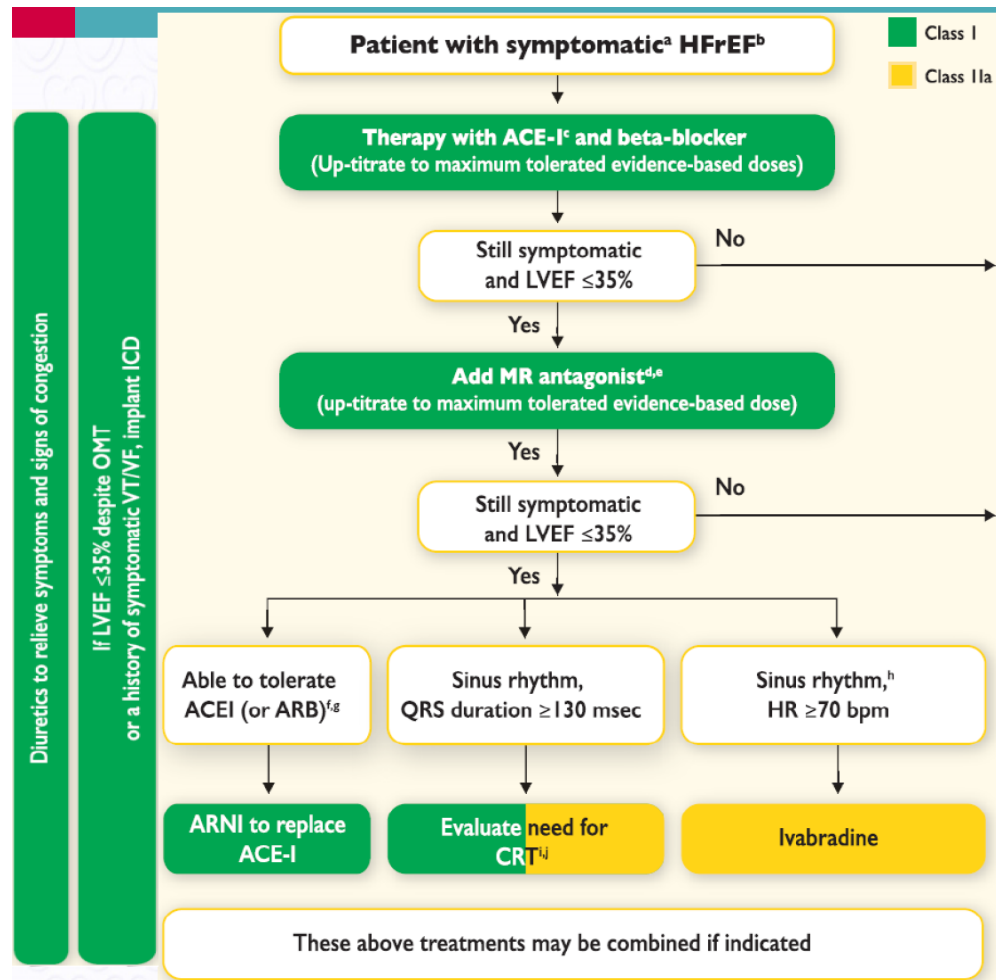

### 4. Severe impairment of functional capacity

- 6MWD < 300 m
- pVO<sub>2</sub> 12-14 ml/kg/min

**Despite optimal guideline-directed therapy !**

# Does our lady have optimal medical therapy ?

Treatment of Mrs I.M.

- Candesartan 4 mg x 2
- Carvedilol 6.25 x 2
- Spironolactone 12.5 mg
- Torasemide 20 mg

# Should we switch the ARB for Entresto ?

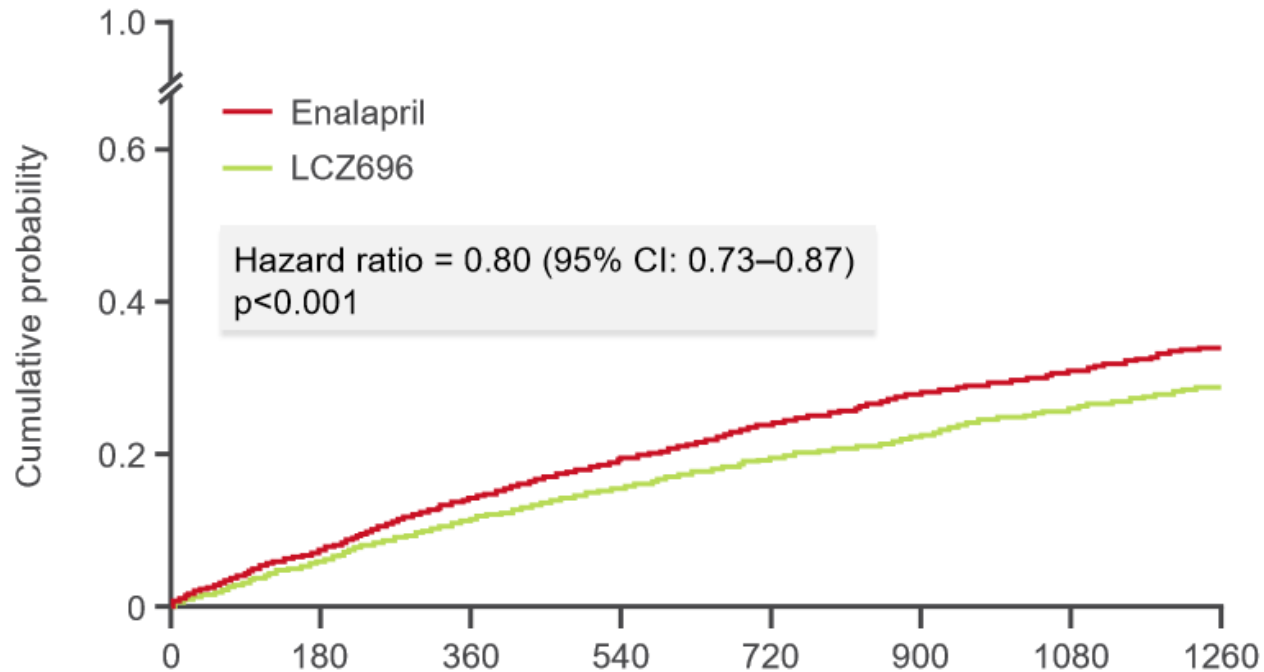

PARADIGM-HF trial

8442 patients randomized for enalapril 2 x 10 mg or Entresto 2 x 200 mg

Almost no patient in NYHA 4 (60 patients only !!!)

Primary endpoint:

Death from CV causes or first hospitalization for HF

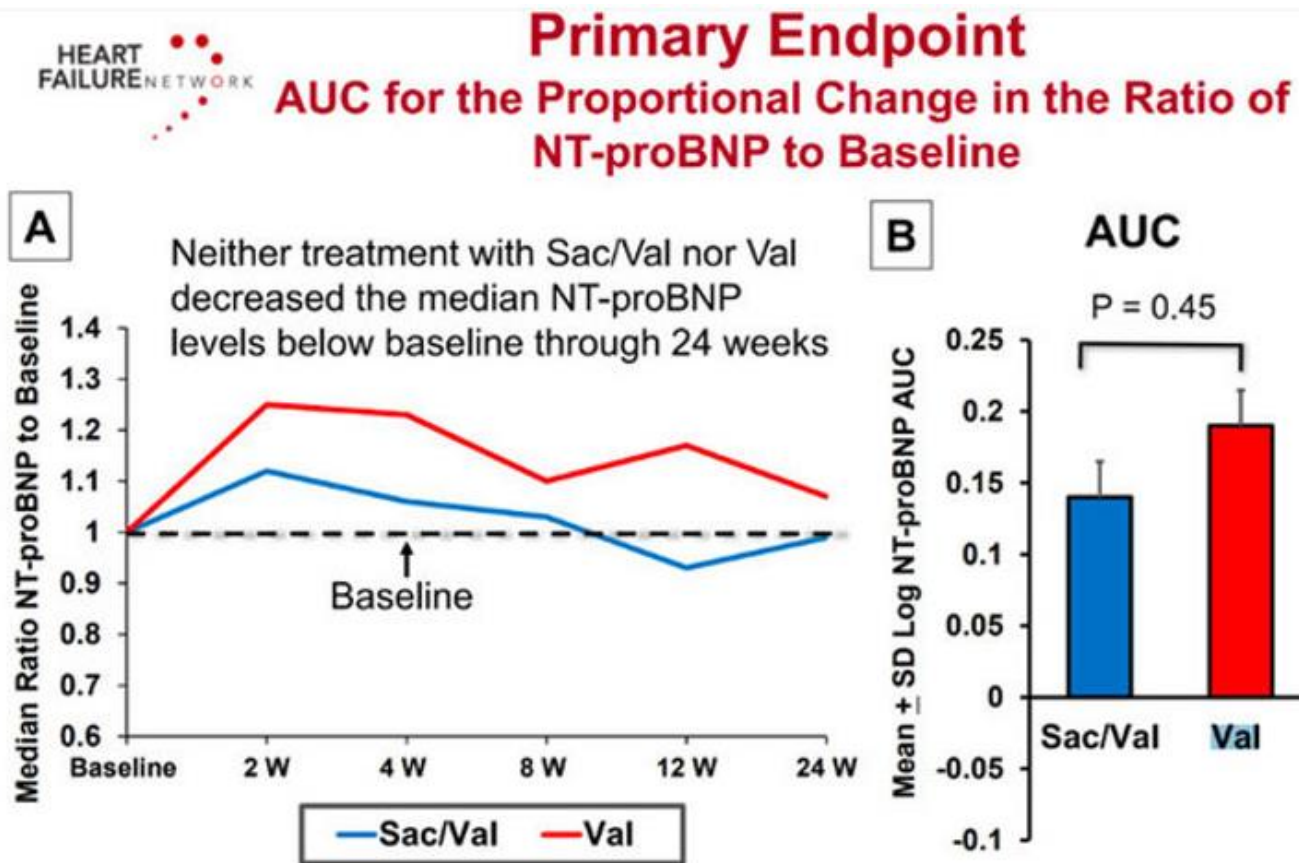

Frequent hypotension !

# Should we switch the ARB for Entresto ?

LIFE-HF trial

335 patients with NYHA 4 HF, SBP > 900 mmHg, randomized between entresto and valsartan

Primary endpoint : NTproBNP change after 24 weeks

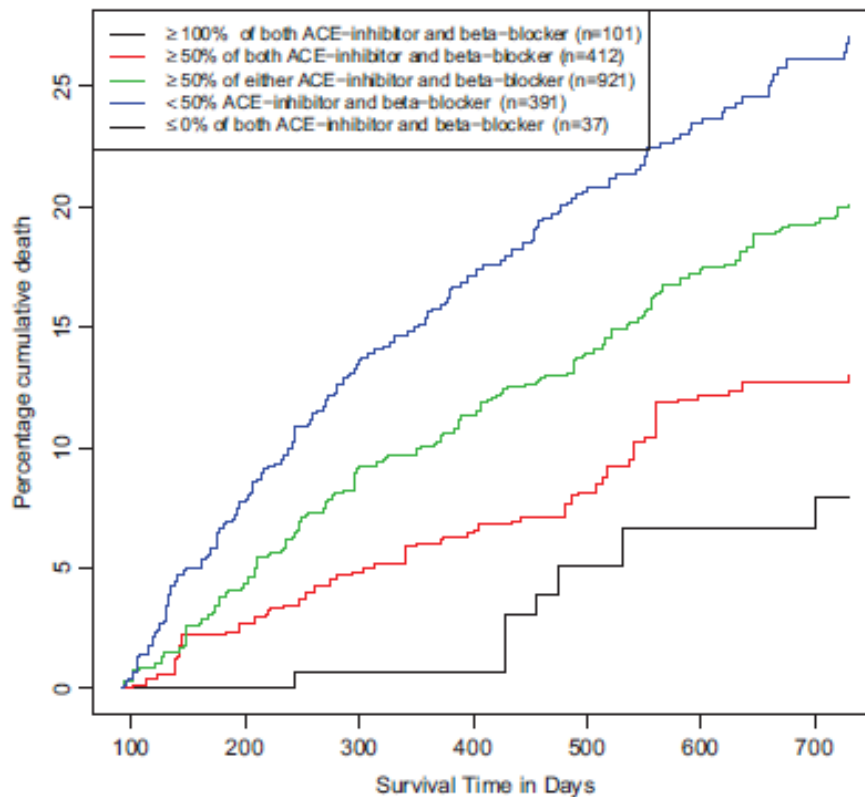

# Should we titrate the existing therapy ?

BIOSTAT-CHF trial

69 centers, 11 European countries

2100 patients with HFrEF inclus, mean follow-up 21 months

$< 50\%$  ACEi/ARB with  $< 50\%$  BB

$> 50\%$  ACEi/ARB or BB with  $< 50\%$  of the other

$> 50\%$  ACEi/ARB +  $> 50\%$  BB

100% ACEi/ARB + 100% BB

# Should we titrate the existing therapy ?

Frequent barriers to therapy up-titration :

Low blood pressure

Low heart rate

Renal failure

Hyperkalemia

Acute heart failure (BB)

Treatment optimisation

with

Low blood pressure

## HF therapy lowers BP, particularly ACEi / ARB / ARNI

Dose dependent reduction of BP

ATLAS trial : 3164 patients, LVEF < 30% randomized to lisinopril low dose (5 mg) vs high dose (35 mg)

Effect on high dose as compared to low dose :

**SBP -4.4+/-0.6 mmHg**

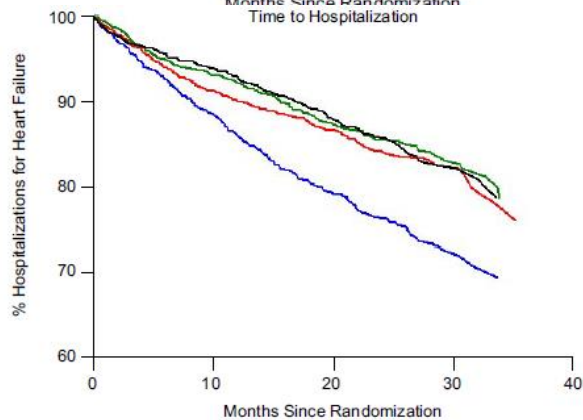

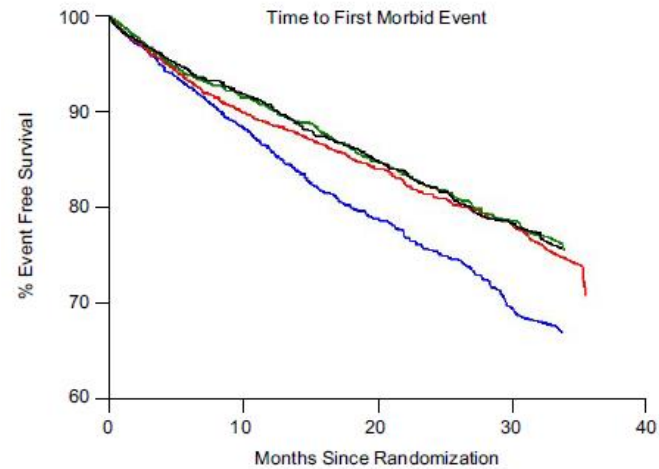

**DBP -2.3 +/- 0.4 mmHg**

similar for ARB / ARNI / BB...

# Low blood pressure related to prognosis !

## Hypotension related to outcome

VAL-HEFT trial : 5010 patients : outcome according to quartiles of SBP : (Q1: >135 mmHg, Q 2 :121-135 mmhg, Q3 : 110-121 mmHg, Q4 : <110 mmhg)

All outcomes occur earlier in HF patients with lower BP !

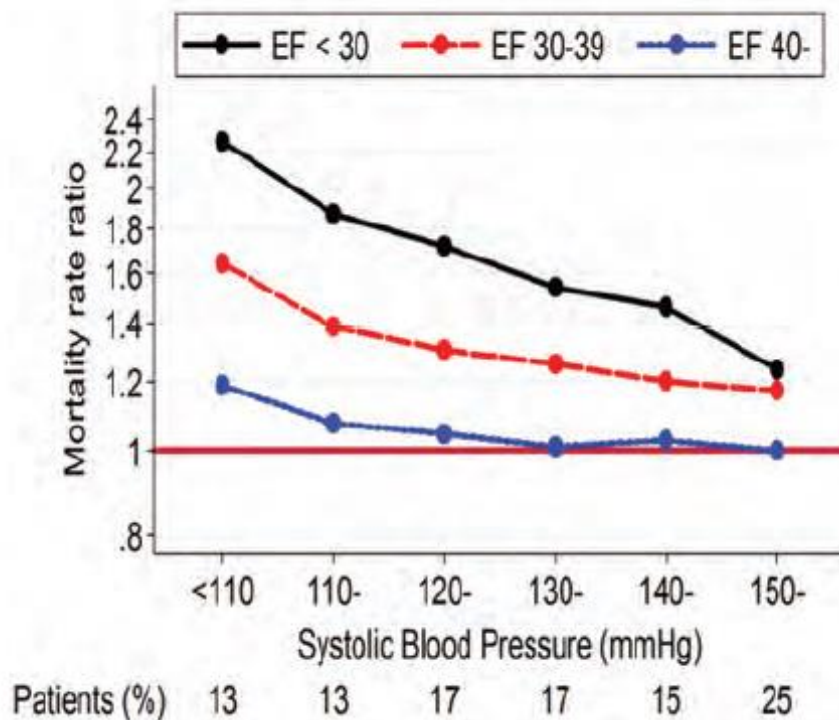

Univariate analysis

## Attenuated effect in multivariate analysis

### MAGICC score

Score based on 39732 patients from 30 studies

In multivariate analysis, rate ratio = 0.882 (95% CI 0.855-0.91) for mortality for each 10 mmHg increase.  $P < 0.0001$ ; significant after adjustment age, sex, NYHA, EF, creatinine...

But effect on outcome largely attenuated by other factors accounting for disease severity, like LVEF especially.

Hypotension is more a marker of SEVERE HF than an independent prognostic variable

## Hypotensive patients benefit from ACEi / ARB !

VAL-HEFT trial : 5010 patients

Effect of Valsartan as compared to placebo according to SBP

**Table 3. Effect of Valsartan Versus Placebo on Mortality, First Morbid Event, and Hospitalizations for HF in Patients Grouped by Baseline SBP**

	Mean Baseline SBP, mm Hg Mean±SD		No. of Patients		Mortality, HR (95% CI)	First Morbid Event, HR (95% CI)	Hospitalization for HF, HR (95% CI)
	Placebo	Valsartan	Placebo	Valsartan			
Q1	102±5	101±6	474	466	0.82 (0.63 to 1.06)	0.74 (0.60 to 0.91)	0.60 (0.45 to 0.79)
<i>P</i>					0.13	0.005	<0.001
Q2, Q3, and Q4 combined	131±16	130±15	1657	1623	1.04 (0.88 to 1.23)	0.90 (0.79 to 1.02)	0.77 (0.64 to 0.93)
<i>P</i>	...	...	...	...	0.64	0.10	0.006
Interaction <i>P</i>	...	...	...	...	0.15	0.29	0.36

As patients with the most severe HF, hypotensive ones benefit MORE from RAASi than normotensive ones.

# How to deal with hypotension in every day life ?

No evidence in the litterature

Expert opinion only !!

## Definition of hypotension

- No definition based on BP !!
- In trials, Hypotension defned by clinical judgement rather than BP threshold
- Hypotension is therfore relevant when *SYMPTOMATIC* (dizziness, light-headedness, especially when getting up from a chair or during the first 3 minutes of walking, fatigue, syncope in severe cases)
- Symptoms should guide management rather than BP values
- (Low BP ususally also considered when SPB < 90 mmHg asymptomatic)

# How to deal with hypotension in every day life ?

TAS 90-100 mmHg

TAS  $\leq$  90 mmHg (asy)

Monitor GFR, K+  
And heart rate

GFR > 25, K < 5, → NO → Reduce ACEi/ARB/ARNI  
HR > 60-65 or BB accordingly

YES

Continue titration  
Slowly  
Small steps

# How to deal with hypotension in every day life ?

TAS 90-100 mmHg with symptoms

TAS  $\leq$  90 mmHg with symptoms

## STEP II

Stop/Reduce non-HFrEF BP lowering therapies  
calcium antagonists, centrally-acting antihypertensive drugs, alpha-blockers  
(sometimes used for prostate conditions), nitrates or all other vasodilators

Persistent low BP with related symptoms

## STEP III

## How to deal with hypotension in every day life ?

### STEP III

Lower diuretics dose in non-congestive patients

Clinical evaluation, BNP/NT pro BNP, lung ultrasound,  
echocardiography, congestion score

Diuretics absolutely necessary in acute heart failure when congestion threaten patient's organ function

Diuretic = barrier to guideline therapy uptitration once the patient decongested !

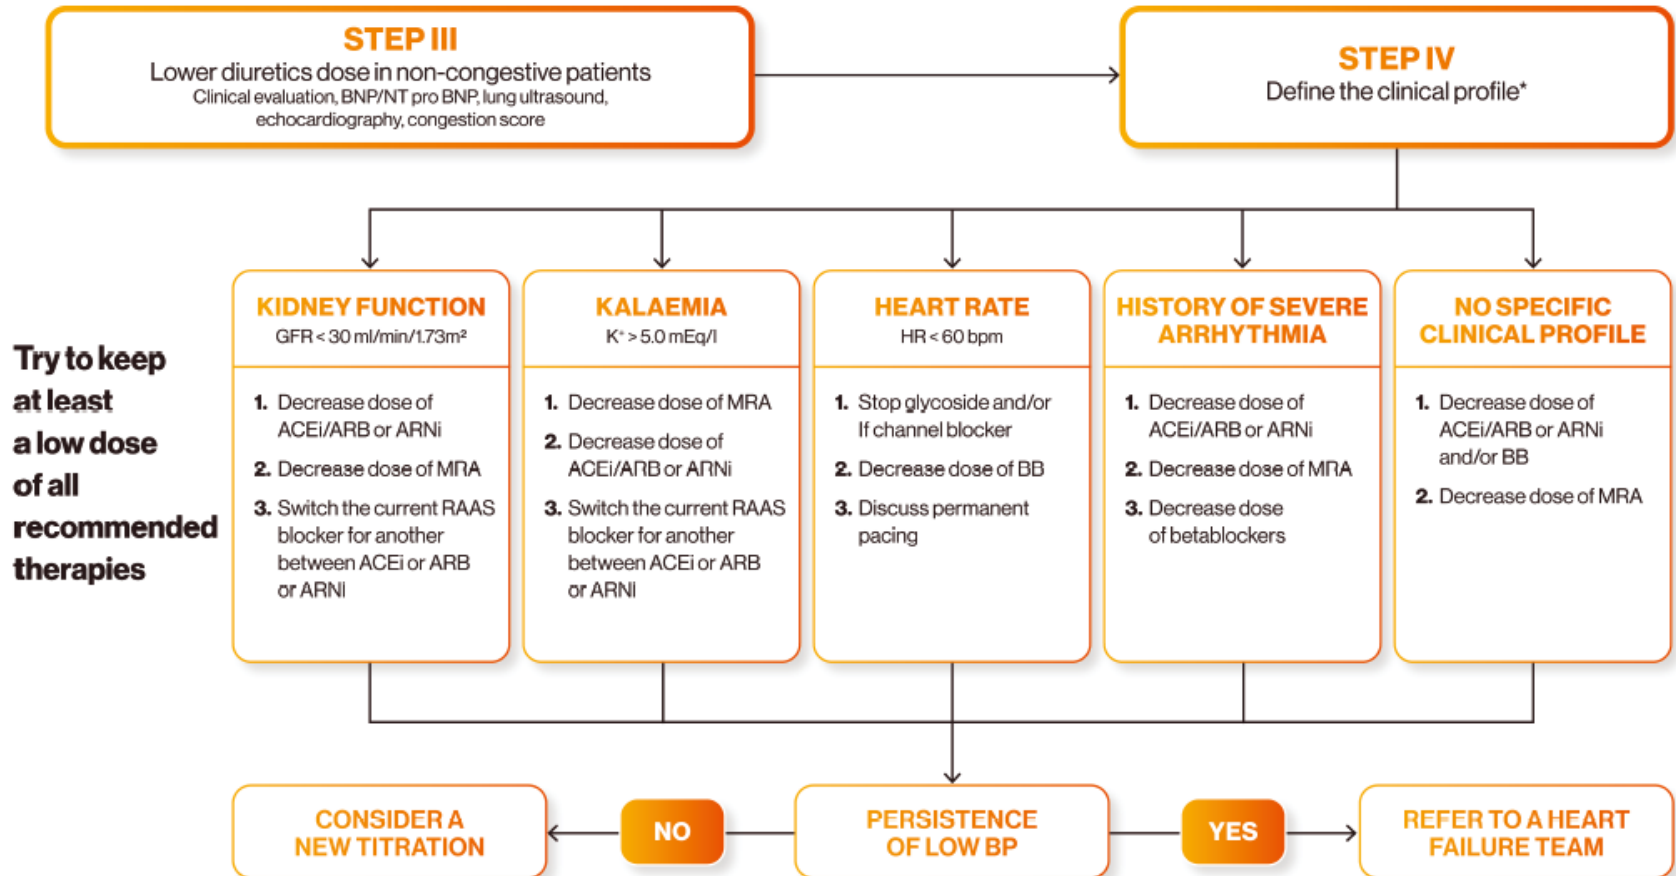

1° Assess congestion clinically (jugular vein, Hepatojugular reflux, peripheral edema, inspiratory fine crackles)

2° If difficult (obesity, post-thrombotic syndrome, varicose veins), assess inferior vena cava by echocardiography (should be < 2 cm)

3° If no congestion, decrease diuretics carefully

4° if still non congestion, withdraw diuretics

# How to deal with hypotension in every day life ?

Treatment optimisation

with

Renal failure

## How to deal with HF therapy in case of renal failure ?

# Baseline kidney function associated with outcome in chronic HF

Meta-analysis, 57 studies, 1'076'104 patients

## Chronic Heart Failure

Dries (SOLVD Prevention)	167	757	397	2916	2.5%	1.80 [1.47, 2.20]	2000

Iglesias	47	221	49	461	4.2%	2.27 [1.47, 3.52]	2008
Damman	30	106	76	894	3.9%	4.25 [2.62, 6.89]	2010
<b>Subtotal (95% CI)</b>		<b>2771</b>		<b>8516</b>	<b>23.6%</b>	<b>1.96 [1.48, 2.61]</b>	

Total events 807 1539

Heterogeneity:  $\text{Tau}^2 = 0.07$ ;  $\text{Chi}^2 = 16.14$ ,  $\text{df} = 4$  ( $P = 0.003$ );  $I^2 = 75\%$

Test for overall effect:  $Z = 4.66$  ( $P < 0.00001$ )

- Subgroup chronic heart failure
- WRF as defined in individualized studies (absolute / relative increase in serum creatinine, cystatin C or eGFR)
- OR for all-cause mortality : 1.96

# Effects of HF and RAASi on GFR

Heart failure  
 ↓  
 Low CO / low BP  
 ↓

Triggers renal auto-regulation of blood flow to preserve GFR

↓  
 A. Afferens

↓  
 Dilation

↓  
 1. Through direct Myogenic reflex

2. Through NO > Macula densa (low NaCl sensing)

↓  
 A. Efferens

↓  
 Constriction

↓  
 Through AngII via

1. sympathetic stimulation of juxtaglomerular cells

2. Through PGE2 > Macula densa (low NaCl sensing)

RAAS inhibition

↓ GFR about 15-20%

- Intraglomerular HD change
- ≠ kidney injury
- Usually reversible
- As opposed to DM or CKD, no data showing long term decrease of loss pace

# Effects of RAASi on heart failure and prognosis

## A END-DIASTOLIC VOLUME

## B END-SYSTOLIC VOLUME

Figure 1. Cumulative Probability of Death in the Placebo and Enalapril Groups.

## Benefit of RAASi.... Also in CKD patients !

Cohort of 1042 HF patients, 69 years old

17% GFR >90ml/min; 26% GFR 60-90 ml/min; 41% GFR 30-60 ml/min; 16% GFR <30 ml/min

OR for global mortality at 1 year  
with GFR <30 : 2.48

1% increase mortality for each  
1 ml/min GFR loss

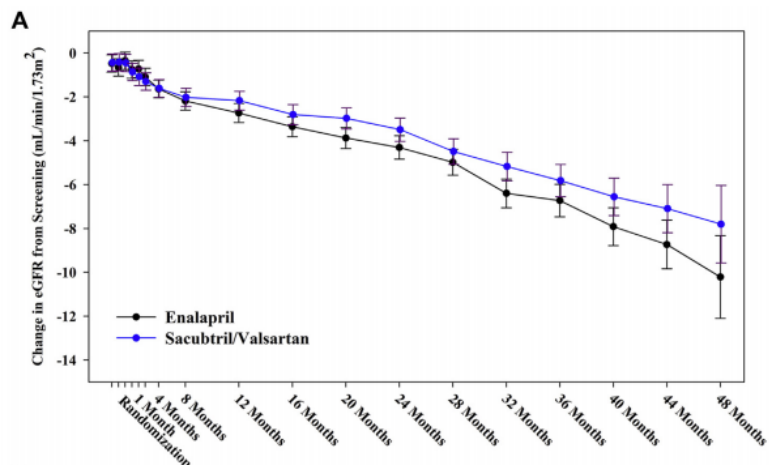

ACEi / ARB lower 1 y mortality  
(OR = 0.4 (65% CI 0.24-0.66) in the  
whole cohort

ACEi / ARB effect on mortality similar :

- In patients with GFR >60ml/min  
(OR=0.28; 95% CI 0.11-0.7)
- In patients with GFR <60 ml/min  
(OR=0.46; 95% CI 0.26-0.82)

## Benefit of ARNi as compared to ACEi on GFR loss

Sub-analysis of the PARADIGM-HF trial, 8399 patients  
GFR 70 +/- 20 ml// at screening; 33% with CKD (<60 ml//)

GFR loss less important on Entresto than on enalapril (-1.61 ml/year)

Despite increased albuminuria

- Transient after ARNi cessation
- Generally associated with true renal injury (diabetes) leading to true WRF
- Transient effect of natri-uretic peptides on mesangial cells and podocytes ?

# What about MRAs and renal failure ?

Heart failure patients benefit form MRA

Including with advanced symptoms (RALES trial with spironolactone)

No. at Risk

Placebo	1373	848	512	199
Eplerenone	1364	925	562	232

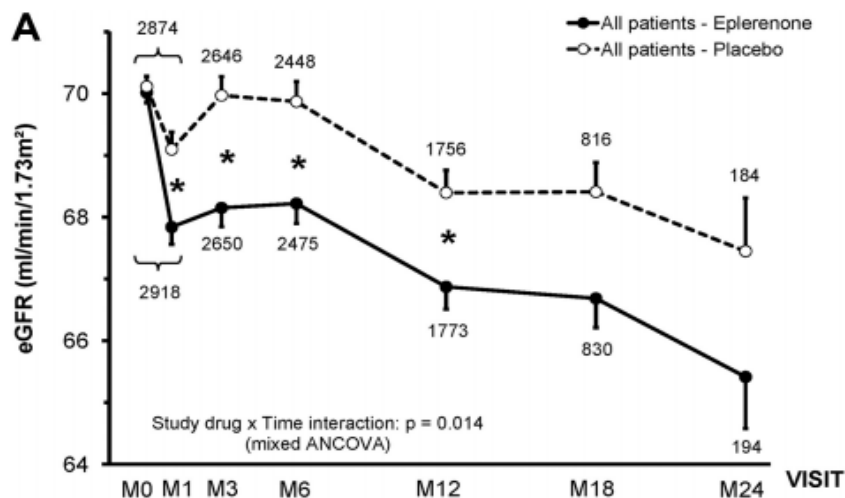

No. AT RISK

Placebo	841	775	723	678	628	592	565	483	379	280	179	92	36
Spironolactone	822	766	739	698	669	639	608	526	419	316	193	122	43

# Effect of MRAs on GFR and prognosis with CKD

Ephesus trial. Post MI. LVEF <40%.

Small placebo-adjusted effect of eplerenone on GFR : -1.4 ml/'' / year

Patients with deteriorated renal function after MI had worse prognosis

But eplerenone is of equal benefit with or without CKD

HR for death and hospitalization without eplerenone according to GFR

- >60 ml/'' : 1.4 (95% CI 1.23-1.6)
- <60 ml/'' : 1.23 (95% CI 1.01-1.5)

# Practical management of RAASi in «advanced» HF and CKD

« Advanced » Heart failure patient with CKD and low-dose RAASi

(S creatinine > 50% baseline)  
S creatinine > 265 µmol/L  
eGFR < 25 ml/min

No potential to titrate RAASi

Assess congestion

No

Assess  
Hypotension/  
Hypoperfusion

Severe worsening  
renal function  
Intrinsic renal disease

Nephrologist

Yes

Treat congestion  
Re-assess renal function

Yes

Reduce (stop?) RAASi  
Consider inotropic support, heart transplantation, MCS  
as appropriate

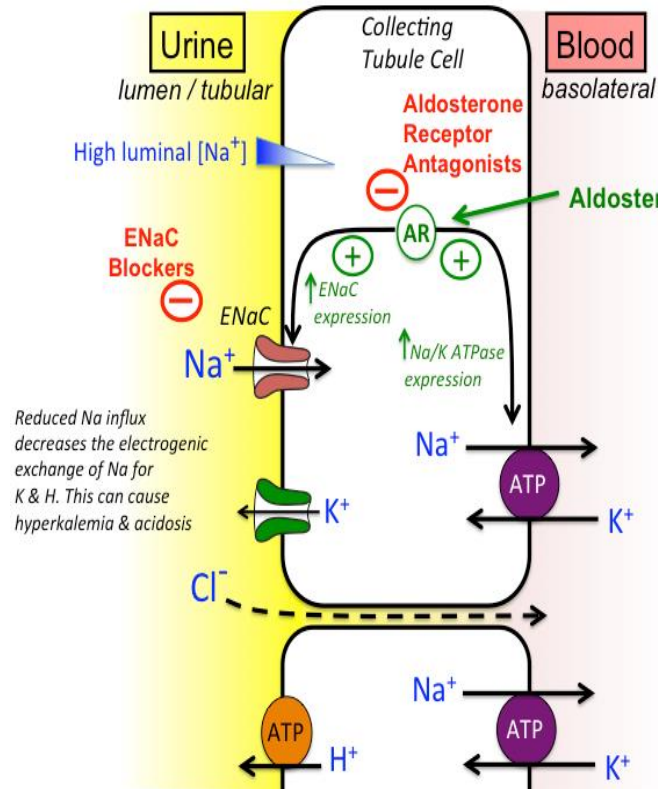

(S creatinine < 50% baseline)  
S creatinine < 265 µmol/L  
eGFR > 25 ml/min

RAASi must be titrated

(unless other contra-indication)  
Until maximal dose  
Until thresholds reached  
( assess K+ and Screat every 2 wks)

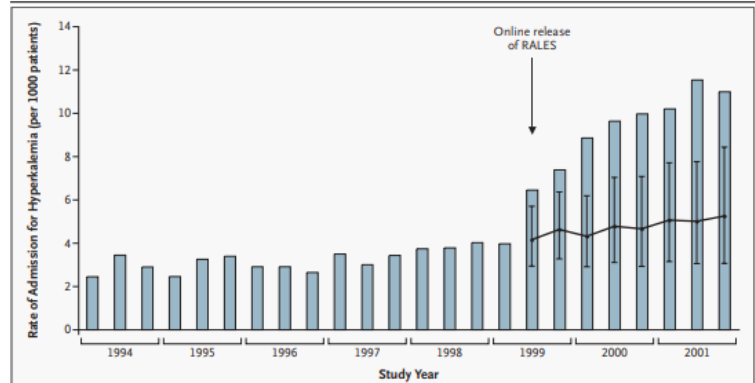

Treatment optimisation  
with  
Hyperkalemia

# RAASi increase serum K<sup>+</sup> level, especially MRAs

2-5% of filtered Na is normally reabsorbed in the collecting duct

- Aldosterone antagonists**
- Loss of Na & Water
  - Hyperkalemia
  - Some risk for acidosis

**Figure 2. Rate of Hospital Admission for Hyperkalemia among Patients Recently Hospitalized for Heart Failure Who Were Receiving ACE Inhibitors.** Each bar shows the rate of hospital admission for hyperkalemia per 1000 patients during one four-month interval. The line beginning in the second interval of 1999 shows projected admission rates for hyperkalemia derived from interventional ARIMA models, with 1 bars representing the 95 percent confidence intervals.

**Figure 3. Rate of In-Hospital Death Associated with Hyperkalemia among Patients Recently Hospitalized for Heart Failure Who Were Receiving ACE Inhibitors.** Each bar shows the rate of in-hospital death associated with hyperkalemia per 1000 patients during one four-month interval. The line beginning in the second interval of 1999 shows projected death rates derived from interventional ARIMA models, with 1 bars representing the 95 percent confidence intervals.

## Management of hyperkalemia

Mild hyperkalemia : 5.1-5.5 mmol/L

Moderate hyperkalemia : 5.6-6.0 mmol/L

Severe hyperkalemia :  $\geq 6.1$  mmol/L

} Associated with increased mortality

HyperK > 2 times per year in 50% HF patients with DM and / or CKD

2 novel agents available :

- Sodium zirconium cyclosilicate, not (yet?) reimbursed in CH
- Patiomer, approved for re-imbursment in CH, K<sup>+</sup>/Ca<sup>++</sup> exchange in the colon.
  - Rapid K<sup>+</sup> normalisation
  - Low incidence of hypokalemia
  - RAASi titration enablement
  - No data on hard endpoints yet (DIAMOND trial on track)
  - Well tolerated, but watch hypomagnesemia and drug interactions

# Practical management of hyperkalemia

	Normokalemia	Chronic hyperkalemia			
1. Serum K <sup>+</sup>	Column A 4–5 mEq/L <sup>(1)</sup>	Column B <b>Mild</b> 5.1–5.5 mEq/L		Column C <b>Moderate</b> 5.6–6 mEq/L	Column D <b>Severe</b> > 6 mEq/L
2. Patients undergoing RAASi optimization	Not on maximal tolerated RAASi dose	Not on maximal tolerated RAASi dose	Not on maximal tolerated RAASi dose <i>but</i> previous hyperkalemia when up-titrating RAASi <i>or</i> HF and/or CKD 3b–4 <sup>a</sup> and/or DM	Whether on or not on maximal tolerated RAASi dose	Whether or not on maximal tolerated RAASi dose
3. Actions	Initiate/up-titrate RAASi	Initiate/up-titrate RAASi	Initiate/up-titrate novel potassium binders/patiromer <sup>b</sup> until serum K <sup>+</sup> ≤ 5.0 mEq/L <sup>(4)</sup>	Initiate/up-titrate novel potassium binders/patiromer <sup>b</sup> until serum K <sup>+</sup> ≤ 5.0 mEq/L <sup>(4)</sup>	Discontinue/Reduce RAASi and
	↓ Monitor K <sup>+(2)</sup>	↓ Monitor K <sup>+(2)</sup>	↓ Monitor K <sup>+(3)</sup>	↓ Monitor K <sup>+(3)</sup>	← Initiate/up-titrate novel potassium binders/patiromer <sup>b</sup> until serum K <sup>+</sup> ≤ 5.0 mEq/L <sup>(4)</sup>
	↓ K <sup>+</sup> ≤ 5      ↓ K <sup>+</sup> > 5 see columns B, C, or D	↓ K <sup>+</sup> ≤ 5.5      ↓ K <sup>+</sup> > 5.5 see columns C or D	↓ If K <sup>+</sup> ≤ 5.0 up-titrate RAASi and maintain novel potassium binders/patiromer <sup>b(4)</sup>	↓ If K <sup>+</sup> ≤ 5.0 up-titrate RAASi and maintain novel potassium binders/patiromer <sup>b(4)</sup>	
4. Follow-up	Maintain RAASi on maximal tolerated doses, monitor K <sup>+</sup> and renal function, and check for additional causes of hyperkalemia (K <sup>+</sup> diet content, salt substitutes, drugs impairing renal function and K <sup>+</sup> excretion)				

Optimalising  
Beta blockers  
And  
Heart rate

# Practical management of hyperkalemia

Beta-blockers		
Bisoprolol	1.25 o.d.	10 o.d.
Carvedilol	3.125 b.i.d.	25 b.i.d. <sup>d</sup>
Metoprolol succinate (CR/XL)	12.5–25 o.d.	200 o.d.
Nebivolol <sup>e</sup>	1.25 o.d.	10 o.d.

# Should we aim at maximal dosing or at specific heart rate (in SR) ?

HF-Action trial, 2331 patients, all ambulatory, LVEF < 0.35

**FIGURE 1** All-Cause Death or Hospitalization by BB Dose (High/Low) and HR (High/Low) at Baseline

1	845	817	781	659	538
2	808	790	760	661	550
3	366	346	326	278	240
4	301	291	274	231	185

# Should we aim at maximal dosing or at specific heart rate (in SR) ?

## Tertile 1 (largest HR reduction)

CHRISTMAS, 2003 (32)	8/193	6/194
Cohn et al, 1997 (29)	2/70	2/35
MERIT-HF, 2000 and 2002 (22, 23) (high dose)	59/1202	77/922
MERIT-HF, 2000 and 2002 (22, 23) (low dose)	38/604	77/923
MOCHA, 1996 (28) (high dose)	1/89	4/28
MOCHA, 1996 (28) (low dose)	5/83	5/28
Olsen et al, 1995 (25)	1/36	0/24
Packer et al, 1996 (27)	6/133	11/145
Subtotal	2410	2299

Total events: 120 (β-blocker); 182 (placebo)  
 Test for heterogeneity: chi-square = 8.35; P = 0.30; I<sup>2</sup> = 16.2%  
 Test for overall effect: z = 3.01 (P = 0.003)

## Tertile 2

Anderson et al, 1985 (19)	5/25	6/25
Bristow et al, 1994 (38) (high dose)	0/35	0/11
CIBIS, 1994 (34)	53/320	67/321
CIBIS II, 2001 and 1999 (11, 35)	156/1327	228/1320
CIBIS III, 2005 (36)	23/505	32/505
COPERNICUS, 2001 (31)	130/1156	190/1133
ENECA, 2005 (42)	7/134	7/126
MOCHA, 1996 (28) (medium dose)	6/89	4/28
Subtotal	3591	3469

Total events: 380 (β-blocker); 534 (placebo)  
 Test for heterogeneity: chi-square = 1.67; P = 0.95; I<sup>2</sup> = 0%  
 Test for overall effect: z = 5.80 (P < 0.001)

## Tertile 3

ANZ, 1997 (30)	20/207	26/208
BEST, 2001 (39)	411/1354	449/1354
Bristow et al, 1994 (38) (low dose)	1/38	1/12
Bristow et al, 1994 (38) (medium dose)	3/32	1/11
CARMEN, 2004 (33)	14/191	14/190
MDC, 1993 (20)	23/194	21/189
SENIORS, 2005 (41)	169/1067	192/1061
Woodley et al, 1991 (37)	0/30	0/20
Subtotal	3113	3045

## Mortality

- dépends HR lowering (tertiles)
- ↓18% RR by 5 bpm HR decrease
- Not related to the dose !
  - Dose > 50% target dose  
RR = 0.74
  - Dose < 50% target dose  
RR = 0.78

# Should we aim at maximal dosing or at specific heart rate (in SR) ?

Swedberg et al, the SHIFT Trial, Lancet 2010

# Should we aim at maximal dosing or at specific heart rate (in SR) ?

HR  $\geq 70$  bpm insinus rythm, Ivabradine vs placebo

# Optimizing heart failure therapy

## in advanced heart failure :

### Other therapies

## Other therapies to optimize HF treatment in AdHF

### CRT

Of benefit in ambulatory stage IV patients

Probably of benefit in inotrope dependent patients

### SGLT2i

Not enough data in stage IV patients, not enough data in AdHF

# Other therapies to optimize HF treatment in AdHF

## Omecantiv mercabile

Primary Outcome

NYHA class

II		0.97 (0.87–1.08)
III or IV		0.88 (0.80–0.97)

LVEF

≤Median (28%)		0.84 (0.77–0.92)
>Median (28%)		1.04 (0.94–1.16)

# Mrs I. M; 58 years old in 2017

After 1 year

## Clinical Assessment

- No congestion, IVC 17 mm, inspiratory collapse 40%
- BP : 94 /60 mmhg
- Sinus rythm 64 bpm, narrow QRS (90 ms)

## Investigations

- LVEF 35%, no significant MR, no RV dysfunction
- Peak VO<sub>2</sub> : 15.4 ml/kg /min, VE/VCO<sub>2</sub> slope 32.5

## Mrs I. M; 57 years old in 2017

### Labo :

- NTproBNP 1600
- Creatinine 196  $\mu\text{mol/l}$
- K<sup>+</sup> 4.9 mmol /L

### Treatment

- Candesartan 8 mg x 2
- Carvedilol 12.5 x 2
- Spironolactone 25 mg
- Torasemide 5 mg

ICD in primary prevention, no sustained VT
